

**Morpholiniocarboxylic ester salts and morpholinio
alkylphenyl ether salts, methods of producing them
and their use as fungicides**

5 The invention relates to novel N-alkyl-2,6-
dimethylmorpholiniocarboxylic ester salts and N-alkyl-
2,6-dimethylmorpholinio alkylphenyl ether salts, to
their preparation and to their use as fungicidal agents
in agriculture and horticulture with additional plant-
10 growth-regulatory properties.

It is known to use N-alkylmorpholines and their salts
as well as their molecular compounds and addition
compounds as fungicides (DE-PS 1 164 152,
15 DE-PS 1 173 722, DE-PS 24 61 513).

It is furthermore known that quaternary ammonium
compounds of long-chain N-alkyl-2,6-dimethylmorpholines
having lower alkyl, alkenyl, alkoxyalkyl or aralkyl
substituents are fungicidally active (DE-PS 1 167 588;
20 Angewandte Chemie 77 (1965), p. 327-333). There are
furthermore known compositions which contain
substituted N-benzyl- or alkoxymethyl-2,6-dimethyl-
morpholinium salts as active compounds for combating
fungal pathogens (DD 134 037, DD 134 474, DD 140 403).
25 It is furthermore known that salts of
morpholinocarboxylic esters with long-chain
alkanesulphonic acids or alkanecarboxylic acids have
fungicidal properties (DD 201 371).

30 It is furthermore known that morpholinoalkyl alkyl
ethers, 4-alkylcyclohexyl ethers and 4-alkylaryl ethers
have fungicidal properties (DE-PS 1 190 724; Angewandte
Chemie 77 (1965), p. 327-333; Angewandte Chemie 92
(1980), p. 176-181). It is furthermore already known to
35 use 2,3-dihydro-6-methyl-5-phenylcarbamoyl-1,4-
oxathiine 4,4-dioxide (oxycarboxin), N,N'-bis(1-
formamido-2,2,2-trichloroethyl)piperazine (triforine) or
zinc ethylenebisdithiocarbamate (zineb) as active
compounds in fungicidal compositions for combating

fungal plant diseases (The Pesticide Manual, British Crop Protection Council; London, 1984).

However, the activity of the above-mentioned compounds
5 in certain fields of indication is not always fully
satisfactory, in particular when low rates and
concentrations are applied. Moreover, they have a
fairly high selectivity regarding certain species of
fungal pathogens, which greatly limits the broad use of
10 these compositions. A further disadvantage is that the
plant tolerance of these compounds is not sufficient in
many cases.

The invention is based on the object of providing novel
15 N-alkyldimethylmorpholinocarboxylic ester salts and
fungicidal compositions containing them which have a
good activity and a broad spectrum of action and as
high as possible a plant tolerance and additional
plant-growth-regulatory properties.

20 To achieve this object there are proposed compounds
which are characterized in that they contain at least
one N-alkyl-2,6-dimethylmorpholinocarboxylic ester
salt or N-alkyl-2,6-dimethylmorpholinio alkylphenyl
25 ether salt of the general formula I,

wherein A represents the group

in which

- R¹ represents straight-chain or branched alkyl having 6 to 20 C atoms,
- 5 R² represents straight-chain or branched alkylene having 1 to 6 C atoms,
- R³ represents straight-chain or branched alkyl having 1 to 20 C atoms,
- 10 a straight-chain or branched alkyl which has 1 to 6 C atoms and which is substituted by halogen, hydroxyl, alkoxy having 1 to 4 C atoms, dialkylamino having 2 to 16 C atoms, nitro and/or cyano,
- an alkenyl which has 2 to 6 C atoms and which is optionally substituted by halogen,
- 15 alkynyl having 3 to 6 C atoms,
- cycloalkyl having 3 to 12 carbon atoms, it being possible for the cycloalkyl radical optionally to be substituted by one or more alkyl radicals
- 20 having 1 to 7 C atoms,
- cycloalkylalkyl having 4 to 10 C atoms,
- aryl which can be monosubstituted or polysubstituted by identical or different substituents from the series consisting of
- 25 straight-chain or branched alkyl having 1 to 6 C atoms, alkoxy having 1 to 4 C atoms, aryl-lower-alkyl having 7 to 12 C atoms, acyl having 1 to 4 C atoms, halogen, aryl, nitro and/or cyano,
- aryl-lower-alkyl which has 7 to 12 C atoms and
- 30 which can be monosubstituted or polysubstituted by identical or different substituents from the series consisting of straight-chain or branched alkyl having 1 to 6 C atoms, alkoxy having 1 to 4

C atoms, halogen, haloalkyl having 1 to 4 C atoms, nitro and/or cyano,
R⁴, R⁵ and R⁶ independently of one another represent identical or different substituents from the series consisting of hydrogen, straight-chain or branched alkyl having 1 to 6 C atoms, alkoxy having 1 to 4 C atoms, acyl having 1 to 4 C atoms, halogen, haloalkyl having 1 to 4 C atoms, cycloalkyl having 3 to 7 C atoms, aryl-lower-alkyl having 7 to 12 C atoms, aryl, nitro, cyano, thiocyanato, NHCOR', COOR' and/or CONR'R" it being possible for R' and R" independently of one another to represent hydrogen, straight-chain or branched alkyl having 1 to 6 C atoms, aryl or aryl-lower-alkyl having 7 to 12 C atoms,
Z represents oxygen or sulphur and
X[⊖] represents the anion of a nonphytotoxic acid,
in addition to the customary solvents, carriers and/or formulation auxiliaries.

The compounds according to the invention can exist in two different geometric structures as N-alkyl-2,6-cis-dimethylmorpholinio-carboxylic ester salt and N-alkyl-2,6-cis-dimethylmorpholinio alkylphenyl ether salt or N-alkyl-2,6-trans-dimethylmorpholinio-carboxylic ester salt and N-alkyl-2,6-trans-dimethylmorpholinio alkylphenyl ether salt or as the respective mixtures of these two isomers. Not only the isomer mixture as is generated by the synthesis, but also the individual isomers, can be used for the fungicidal application.

Surprisingly, it has been found that the N-alkyl-2,6-dimethylmorpholinio-carboxylic ester salts and N-alkyl-2,6-dimethylmorpholinio alkylphenyl ether salts of the general formula I according to the invention have a potent fungicidal activity and a broad spectrum of action and are suitable in particular for combating phytopathogenic fungi on crop plants and on stored plant-based products. The active compounds are well

tolerated at the application rates required for the
combat of plant diseases. In addition, the compounds
according to the invention can have a desired positive
effect on crop plants, given their growth-regulatory
5 properties.

The N-alkyl-2,6-dimethylmorpholinocarboxylic ester
salts and N-alkyl-2,6-dimethylmorpholinio alkylphenyl
ether salts of the general formula I are obtained by
10 reacting an N-alkyl-2,6-dimethylmorpholine of the
formula II,

15 wherein R¹ has the meaning given in the general formula
I
with a compound of the formula III

20

wherein R² and A have the meaning given in the general
formula I and X represents halogen,
or, alternatively, reacting a 2,6-dimethylmorpholino-
carboxylic ester or 2,6-dimethylmorpholino alkylphenyl
25 ether of the formula IV,

wherein R^2 and A have the meaning given in the general formula I
with a compound of the formula V,

$$5 \quad R^1 - X \quad (V)$$

wherein R¹ has the meaning given in the general formula I and X represents halogen.

10 N-alkyl-2,6-dimethylmorpholines of the formula II are,
for example, n-decyl-, n-dodecyl-, n-tridecyl-, iso-
tridecyl-, 1,5,9-trimethyldecyl-, n-pentadecyl- or
n-didecyl-2,6-dimethylmorpholine.

15 Halocarboxylic esters of the formula III are, for example, C₁-C₂₀-alkyl chloroacetate, 4-chlorobutyl chloroacetate, 4-hydroxybutyl chloroacetate, 2-ethoxyethyl chloroacetate, 2-cyanoethyl chloroacetate, 2-nitroethyl chloroacetate, cyclohexyl chloroacetate, 20 methyl 2-bromopropionate, allyl 2-bromopropionate, 1-naphthyl 2-bromopropionate, phenyl chloroacetate, phenyl thiochloroacetate, methyl 2-bromobutyrate, benzyl 2-bromocaproate, 4-chlorophenyl chloroacetate, 4-tert-butylphenyl chloroacetate, 3,4-dichlorophenyl 25 chloroacetate, 2,6-dimethylphenyl chloroacetate, 2,6-dibromo-4-nitrophenyl chloroacetate, 2,6-dibromo-4-cyanophenyl chloroacetate, 2,6-dichlorobenzyl chloroacetate, 4-cyanobenzyl chloroacetate, 4-nitrophenyl chloroacetate or the chloroacetate anion.

30 Haloalkylphenyl ethers of the formula III are, for example, 2-bromoethyl phenyl ether, 2-chloroethyl-4-tert-butyl phenyl ether, 2-bromoethyl 4-nitrophenyl ether, 2-bromoethyl 4-cyanophenyl ether, 2-bromoethyl
35 2,6-dichlorophenyl ether, 2-bromoethyl 3,4-dichlorophenyl ether, 2-bromoethyl 2,6-dichloro-4-cyanophenyl ether, 2-bromoethyl 3,5-dichlorophenyl ether, 2-bromoethyl 4-benzylphenyl ether, 2-bromoethyl 4-acetamidophenyl ether, 3-bromopropyl phenyl ether, 3-

bromopropyl 4-tert-butylphenyl ether, 3-bromopropyl 2,6-dimethylphenyl ether or 3-bromopropyl 2,6-dibromo-4-thiocyanatophenyl ether.

- 5 2,6-dimethylmorpholinocarboxylic esters of the formula IV are, for example, C₁-C₂₀-alkyl 2,6-dimethylmorpholino-acetate, phenyl 2,6-dimethylmorpholinoacetate, phenyl 2,6-dimethylmorpholinothioacetate, 4-chlorophenyl
- 10 2,6-dimethylmorpholinoacetate, 4-nitrophenyl 2,6-dimethylmorpholinoacetate, 3,4-dichlorophenyl 2,6-dimethylmorpholinoacetate, 2,6-dibromo-4-cyanophenyl 2,6-dimethylmorpholinoacetate, benzyl 2,6-dimethylmorpholinoacetate, 2,6-dichlorobenzyl 2,6-dimethyl-
- 15 morpholinoacetate, methyl 2,6-dimethylmorpholino-2-propionate, methyl 2,6-dimethylmorpholino-2-butyrate or, if R³ is absent, the acetate.

- 2,6-Dimethylmorpholino alkylphenyl ethers of the
- 20 formula IV are, for example, 2-(2,6-dimethylmorpholino)ethyl phenyl ether, 2-(2,6-dimethylmorpholino)ethyl 4-cyanophenyl ether, 2-(2,6-dimethylmorpholino)ethyl 4-tert-butylphenyl ether, 2-(2,6-dimethylmorpholino)ethyl 4-nitrophenyl ether, 2-(2,6-
- 25 dimethylmorpholino)ethyl 3,4-dichlorophenyl ether, 2-(2,6-dimethylmorpholino)ethyl 2,6-dichloro-4-cyanatophenyl ether, 3-(2,6-dimethylmorpholino)propyl phenyl ether, 3-(2,6-dimethylmorpholino)propyl 4-tert-butylphenyl ether, 3-(2,6-dimethylmorpholino)propyl
- 30 3,5-dichlorophenyl ether, 3-(2,6-dimethylmorpholino)propyl 2,6-dimethylphenyl ether or 3-(2,6-dimethylmorpholino)propyl 2,6-dibromo-4-thiocyanatophenyl ether.

- 35 Alkyl halides of the formula V are, for example, n-decyl chloride, n-dodecyl chloride, n-tridecyl chloride, iso-tridecyl chloride, 1,5,9-trimethyldecyl chloride, pentadecyl bromide or didecyl bromide.

The starting compounds for the preparation of the compounds according to the invention are known per se or can be prepared by processes known per se.

5 The reaction to give the compounds of the formula I according to the invention are, if appropriate, carried out in the presence of a solvent or diluent at a temperature in the range of between 10 and 180°C, preferably between 30 and 150°C. The starting
10 substances of the formula II or of the formula IV are reacted in stoichiometric amounts with a compound of the formula III or of the formula V or preferably with an excess of 10 to 100% of a compound of the formula
15 III or of the formula V beyond the stoichiometric amount, based on the starting materials of the formula II or of the formula IV.

Preferred solvents or diluents which can be employed are, for example, aliphatic or aromatic, optionally
20 halogenated hydrocarbons such as n-pentane, cyclohexane, benzene, toluene, chlorobenzene, chloroform or methylene chloride; aliphatic ketones such as acetone, methyl ethyl ketone or cyclohexanone; ethers such as diethyl ether, tetrahydrofuran or
25 dioxane; alcohols such as methanol, ethanol, propanols, butanols or hexanols; nitriles such as acetonitrile; esters, such as methyl acetate; amides such as dimethylformamide, dimethylacetamide or N-methylpyrrolidone; dimethyl sulphoxide or water, or mixtures
30 of these solvents.

The isolation of the compounds of the general formula I according to the invention from the reaction mixtures is not absolutely necessary since they can also be
35 employed for making fungicidal preparations without further purification operation.

The active compounds of the general formula I according to the invention have a potent activity against

microorganisms and can accordingly be used for combating fungal pathogens in agriculture and in horticulture. Using the active compounds, it is possible to combat undesired fungi which are found on
5 plants or plant parts. The active compounds of the general formula I are furthermore suitable as seed-dressing compositions for the treatment of seed and planting material as a protection from fungal infections and can be employed against soil-borne
10 phytopathogenic fungi. In addition, the active compounds, where employed, have a positive effect on the growth processes of crop plants.

The starting compounds for the preparation of the
15 compounds according to the invention are known per se or can be prepared by methods known per se.

The active compounds according to the invention are particularly suitable for preventing and curing plant
20 diseases which are caused by fungus, such as, for example, *Erysiphe graminis* (powdery mildew of cereals), *Erysiphe cichoracearum* (powdery mildew of cucurbits), *Erysiphe polygoni* (powdery mildew of bean), *Podosphaera leucotricha* (apple mildew), *Sphaerotheca pannosa*
25 (powdery mildew of rose), *Uncinula necator* (powdery mildew of grapevine); rust diseases, such as those of the genera *Puccinia*, *Uromyces* or *Hemileia*, in particular *Puccinia graminis* (stem rust of cereals), *Puccinia coronata* (crown rust of oats), *Puccinia sorghi*
30 (maize rust), *Puccinia recondita* (leaf rust of cereals), *Uromyces fabae* (bean rust), *Hemileia vastatrix* (coffee leaf rust); *Botrytis cinerea* on grapevines and strawberries; *Monilia fructigena* on apples; *Plasmopara viticola* on grapevines;
35 *Mycosphaerella musicola* on bananas; *Corticium salmonicolor* on Hevea; *Ganoderma pseudoferreum* on Hevea; *Exobasidium vexans* on tea; *Phytophthora infestans* on potatoes and tomatoes; *Alternaria solani* on tomatoes. Furthermore, various of these active

substances also have different activity against
phytopathogenic fungi such as, for example, *Ustilago*
avenae (loose smut of oats), *Ophiobolus graminis* (foot
rot of cereals), *Septoria nodorum* (leaf spot and glume
5 blotch of cereals), *Venturia inaequalis* (apple scab)
and further fungal pathogens such as *Rhizoctonia*,
tilletia, *Helminthosporium*, *Peronospora*, *Pythium*,
Alternaria, *Mucor*, *Sclerotinia*, *Fusarium*,
Pseudocercospora and *Cladosporium*.

10

Of particular interest are the active compounds
according to the invention for combating a multiplicity
of fungal diseases on a variety of crop plants or their
seeds, in particular wheat, rye, barley, oats, rice,
15 maize, cotton, soya, coffee, bananas, sugar cane,
fruit, ornamentals in horticulture, vegetables such as
cucumbers, beans or cucurbits.

In addition, the active compounds according to the
20 invention can have a positive desired effect on the
development of crop plants as a result of their plant-
growth-regulatory properties. The effects of the
compounds depend essentially on the timing of the
application based on the developmental stage of the
25 seed or the plants, on the application rates applied to
the plants or their environment, and on the type of
application.

Moreover, the active compounds also afford good
30 activity against wood-discolouring and wood-destroying
fungi such as, for example, *Pullaria pullulans*,
Aspergillus niger, *Polystictus versicolor* or *Chaetomium*
globosum.

35 Furthermore, the active compounds of the general
formula I according to the invention display good
activity against moulds such as, for example,
Penicillium, *Fusarium* or *Aspergillus* species, which
bring about a deterioration of agricultural products

with a high water content or processed products of agricultural produce during storage or intermediate storage. Products to be treated in this manner comprise, for example, apples, oranges, tangerines, lemons, grapefruits, peanuts, cereals and cereal products or pulses and ground pulses.

In addition to having a broad fungicidal spectrum of activity, the active compounds according to the invention also display various activities against phytopathogenic bacteria such as, for example, Xanthomonas or Erwinia species.

Some of the active compounds are also active against fungi which are pathogenic for humans, such as, for example, Trichophyton and Candida species.

Some of the active compounds of the general formula I are distinguished by a systemic activity, in addition to the protective activity. Thus, they are taken up both via the root and via the leaves and are translocated in the plant tissue or supplied to the aerial parts of the plants via the seed.

The active compounds according to the invention are furthermore suitable for controlling resistant strains of fungal pathogens which display symptoms of resistance to known fungicidal active compounds, such as, for example, active compounds from the group of the dicarboximide fungicides, such as, for example 5-methyl-5-vinyl-3-(3,5-dichlorophenyl)-2,4-dioxo-1,3-oxazolidine (vinclozolin) or 5-methyl-5-methoxymethyl-3-(3,5-dichlorophenyl)-1,3-oxazolidine-2,4-dione (myclozolin); active compounds from the group of the benzimidazole or thiophanate fungicides such as, for example, methyl 1-(n-butylcarbamoyl)-benzimidazol-2-ylcarbamate (benomyl), methyl benzimidazol-2-ylcarbamate (carbendazim) or 1,2-bis(3-ethoxycarbonyl-2-thioureido)benzene (thiophanate); active compounds

from the group of the azole fungicides such as, for example, 1-(4-chlorophenoxy-3,3-dimethyl-1-(1H-1,2,4-triazol-1-yl)butan-2-one (triadimefon) or 1-[2'-(2'',4''-dichlorophenyl)-2'-(propenyloxy)ethyl]-1,3-imidazole (imazalil); active compounds from the group of the fungicides containing aromatic hydrocarbons such as, for example, 2,5-dichloro-1,4-dimethoxybenzene (chloroneb) or 2,6-dichloro-4-nitroaniline (dichloran); active compounds from the group of the acylalanine fungicides such as, for example, methyl DL-N-(2,6-dimethylphenyl)-N-(2'-methoxyacetyl)alaninate (metalaxyl) or methyl DL-N-(2,6-dimethylphenyl)-N-(2-furoyl)alaninate (furalaxyl), or active compounds from the group of the pyrimidine fungicides such as, for example, 5-butyl-2-dimethylamino-4-hydroxy-6-methylpyrimidine (dimethirimol) or 2-chlorophenyl-4-chlorophenylpyrimidin-5-ylmethanol (fenarimol).

The anions X^- shown in the general formula I of the active compounds according to the invention are not critical for the fungicidal activity.

The active compounds according to the invention can be converted into the customary formulations, such as solutions, emulsions, wettable powders, suspensions, powders, dusts, foams, pastes, soluble powders, granules, natural and synthetic materials impregnated with active compound, and microencapsulations in polymeric substances, and in coating compositions for seeds and in ULV cold- and hot-fogging formulations.

These formulations are produced in a known manner, for example by mixing or grinding the active compounds of the general formula I according to the invention with solvents and/or carriers, optionally with the use of surfactants, that is emulsifiers and/or dispersants.

Liquid solvents which are suitable are: aromatics such as toluene, xylene, or alkyl-naphthalenes; chlorinated

aromatics and chlorinated aliphatic hydrocarbons such as chlorobenzenes, chloroethylenes or methylene chloride; aliphatic hydrocarbons such as cyclohexane or paraffins, for example petroleum fractions; alcohols
5 such as butanols or glycols as well as their esters and ethers; ketones such as acetone, methyl ethyl ketone, methyl isobutyl ketone or cyclohexanone; strongly polar solvents such as water, dimethylformamide and dimethyl sulphoxide. Likewise liquefied solvents which are
10 gaseous under standard conditions, such as, for example aerosol propellants, such as halohydrocarbons, propane, butane, nitrogen and carbon dioxide, may be employed. Suitable solid carriers are, for example, ground natural minerals such as kaolins, clays, talc, chalk,
15 quartz, montmorillonite or diatomaceous earth, and ground synthetic minerals such as highly disperse silica, alumina and silicates. Solid carriers for granules which can be used are, for example, crushed and fractionated natural rocks such as calcite, marble,
20 pumice and dolomite, and synthetic granules of inorganic or organic meals, and granules of organic materials such as sawdust, cellulose powder, tree bark meal, and nutshell meal. Emulsifiers which can be used are, for example,
25 nonionic and anionic emulsifiers such as alkali metal salts, alkaline earth metal salts or ammonium salts of ligninosulphonic acid, naphthalenesulphonic acids, phenolsulphonic acids, alkylarylsulphonates, alkyl sulphates, alkylsulphonates, alkali metal salts and
30 alkaline earth metal salts of dibutyl naphthalenesulphonic acid, lauryl ether sulphate, fatty alcohol sulphates, alkali metal salts and alkaline earth metal salts of fatty acids, salts of sulphated hexadecanols, heptadecanols or octadecanols,
35 salts of sulphated fatty alcohol glycol ethers, condensates of sulphonated naphthalene and naphthalene derivatives with formaldehyde, condensates of naphthalene, or of the naphthalenesulphonic acids, with phenol and formaldehyde, polyoxyethylene octylphenol

ether, alkylphenol polyglycol ether, tributylphenyl polyglycol ether, alkylaryl polyether alcohols, iso-tridecyl alcohol, fatty alcohol/ethylene oxide condensates, ethoxylated castor oil, polyoxyethylene
5 alkyl ethers, ethoxylated polyoxypropylene, lauryl alcohol polyglycol ether acetal and sorbitol esters.

Suitable dispersants are, for example, lignin-sulphite waste liquors and methylcellulose.

Tackifiers such as carboxymethylcellulose and natural
10 and synthetic polymers in the form of latices such as gum arabic, polyvinyl alcohol and polyvinyl acetate, may be used in the formulations.

Further additives which may be present in the
15 formulations of the active compounds may be colorants and trace nutrients.

In general, the formulations contain between 0.1 and 95% by weight of active compound, preferably between
20 0.5 and 90% by weight.

The method according to the invention for controlling fungi is characterized in that an effective amount of fungicidal compositions containing the active compounds
25 of the general formula I according to the invention are allowed to act on fungi or on the objects to be protected from fungal attack.

In the formulations or in the various use forms, the
30 active compounds according to the invention can be mixed, and applied together, with other known active compounds such as fungicides, bactericides, insecticides, acaricides, nematocides, herbicides, growth regulators, plant nutrients and soil
35 conditioners. In many cases, a mixture with fungicides results in a widening of the fungicidal spectrum of action. In a number of mixtures of the active compounds according to the invention with known fungicides, synergistic effects may also be found; here, the

fungicidal activity of the combined product exceeds that of the sum of the activities of the individual components.

Fungicides which can be combined with the active compounds according to the invention, without limiting the possible combinations, are, for example:

sulphur,
dithiocarbamates and their derivatives, such as
iron(III) dimethyldithiocarbamate, zinc dimethyldithio-
10 carbamate, manganese ethylenebisdithiocarbamate,
manganese zinc ethylenediaminebisdithiocarbamate and
zinc ethylenebisdithiocarbamate,
tetramethylthiuram sulphides,
ammonia complex of zinc (N,N-ethylenebisdithio-
15 carbamate) and N,N'-
polyethylenebis(thiocarbamoyl)disulphide,
ammonia complex of zinc (N,N'-
propylenebisdithiocarbamate) and N,N'-
propylenebis(thiocarbamoyl) disulphide,
20 N-trichloromethylthiotetrahydrophthalimide,
N-trichloromethylthiophthalimide,
N-(1,1,2,2-tetrachloroethylthio)tetrahydrophthalimide,
4,6-dinitro-2-(1-(methylheptyl)phenyl crotonate,
4,6-dinitro-2-sec-butylphenyl 3,3-dimethylacrylate,
25 4,6-dinitro-2-sec-butylphenyl isopropylcarbonate,
methyl 1-(n-butylcarbamoyle)benzimidazol-2-ylcarbamate,
methyl benzimidazol-2-ylcarbamate,
2-(fur-2-yl)benzimidazole,
2-(thiazol-4-yl)benzimidazole,
30 1,2-bis(3-methoxycarbonyl-2-thioureido)benzene,
1,2-bis(3-ethoxycarbonyl-2-thioureido)benzene,
2,3-dihydro-6-methyl-5-phenylcarbamoyle-1,4-oxathiine,
2,3-dihydro-6-methyl-5-phenylcarbamoyle-1,4-oxathiine
4,4-dioxide,
35 tetrachloroisophthalonitrile,
2,3-dichloro-1,4-napthoquinone,
2,3-dicyano-1,4-dithioanthraquinone,
N-tridecyl-2,6-dimethylmorpholine and its salts,
N-C₁₀-C₁₄-alkyl-2,5- and/or 2,6-dimethylmorpholine,

N-cyclododecyl-2,6-dimethylmorpholine and its salts,
N-[3-p-tert-butylphenyl]-2-methylpropyl]-2,6-cis-
dimethylmorpholine and its salts,
N,N'-bis(1-formamido-2,2,2-trichloroethyl)piperazine
5 N-(1-formamido-2,2,2-trichloroethyl)-3,4-dichloro-
aniline,
N-(1-formamido-2,2,2-trichloroethyl)morpholine,
5-butyl-2-ethylamino-4-hydroxy-6-methylpyrimidine,
5-butyl-2-dimethylamino-4-hydroxy-6-methylpyrimidine,
10 2,4-dichlorophenylphenylpyrimidin-5-ylmethanol,
2-chlorophenyl-4-chlorophenylpyrimidin-5-ylmethanol,
bis(4-chlorophenyl)pyridin-3-ylmethanol,
5-methyl-5-vinyl-3-(3,5-dichlorophenyl)-1,3-oxazolidine
2,4-dione,
15 5-methyl-5-methoxymethyl-3-(3,5-dichlorophenyl)-1,3-
oxazolidine-2,4-dione,
3-(3,5-dichlorophenyl)-N-isopropyl-2,4-dioxo-
imidazolidine-1-carboxamide,
N-(3,5-dichlorophenyl)-1,2-dimethylcyclopropane-1,2-
20 dicarboximide,
1-(4-chlorophenoxy)-3,3-dimethyl-1-(1,2,4-triazol-1-
yl)-butan-2-one
1-(4-chlorophenoxy)-3,3-dimethyl-1-(1,2,4-triazol-1-
yl)-butan-2-ol
25 1-[2-(2,4-dichlorophenyl)-2-(propenyloxy)ethyl]-
imidazole
1-[N-propyl-N-(2,4,6-trichlorophenoxy)ethyl-
carbamoyl]imidazole
1-[2-(2,4-dichlorophenyl)-4-ethyl-1,3-dioxolan-2-yl-
30 methyl]-1H-1,2,4-triazole
1-[2-(2,4-dichlorophenyl)-4-n-propyl-1,3-dioxolan-2-yl-
methyl]-1H-1,2,4-triazole
1-(2,4-dichlorophenyl)-2-(1,2,4-triazol-1-yl)-4,4-
dimethylpentan-3-one
35 2,5-dichloro-1,4-dimethoxybenzene
2,6-dichloro-4-nitroaniline
diphenyl
2-methylbenzoanilide
2-iodobenzoanilide

- 2,5-dimethylfuran-3-carboxanilide
2,4,5-trimethylfuran-3-carboxanilide
N-cyclohexyl-N-methoxy-2,5-dimethylfuran-3-carboxamide
3-[3-(3,5-dimethyl-2-oxycyclohexyl)-2-hydroxyethyl]-
5 glutarimide
N-dichlorofluoromethylthio-N',N'-dimethyl-N-phenylsulphodiamide
methyl DL-N-(2,6-dimethylphenyl)-N-(2'-methoxyacetyl)-alaninate
10 methyl DL-N-(2,6-dimethylphenyl)-N-(2-furoyl)alaninate
N-(2,6-dimethylphenyl)-N-chloroacetyl-DL-2-amino-butyrolactone
2,4-dichloro-6-(2-chloroanilino)-s-triazine
O,O-diethyl phthalimidophosphonothioate
15 5-amino-1-(bis(dimethylamino)phosphinyl)-3-phenyl-1,2,4-triazole
O,O-diethyl S-benzyl thiophosphate
2-thio-1,3-dithio(4,5-b)quinoxaline
4-(2-chlorophenylhydrazono)-3-methyl-5-isoxazolone
20 pyridine-2-thiol 1-oxide,
8-hydroxyquinoline and its salts,
sodium 4-dimethylaminophenyldiazosulfonate
diisopropyl 5-nitroisophthalate
2-cyano-N-(ethylaminocarbonyl)-2-(methoxyimino)-
25 acetamide
2-heptadecyl-2-imidazoline acetate
dodecylguanidine acetate

The active compounds as such, in the form of their
30 formulations or in the use forms prepared therefrom by further dilution, can be applied in the usual manner, for example by pouring, dipping, spraying, atomizing, fogging, injecting, slurrying, brushing on, dusting, scattering, dry seed treatment, solvent-based liquid
35 treatment, water-based liquid treatment, slurry treatment or incrusting.

In the treatment of plant parts, the active compound concentrations in the use forms can be varied within a

substantial range. They are, in general, between 0.0001 and 1% by weight, preferably between 0.5 and 0.01% by weight. The application rates of active compound depend on the specific purpose and are generally between 0.1 and 3 kg of active compound per hectare.

In the treatment of seed, active compound quantities of from 0.001 to 50 g or more are generally required per kilogram of seed, preferably from 0.01 to 10 g.

For the conservation or post-harvest-treatment of agricultural commodities or processed agricultural products, the active compound quantities required are from 0.01 to 100 g per kilogram of product to be treated, preferably from 0.1 to 50 g.

Active compound concentrations of from 0.0001 to 0.1% by weight, preferably from 0.001 to 0.05% by weight, are required at the site of action when treating the soil.

Without imposing any limitation, the examples which follow are intended to illustrate the invention in greater detail and to demonstrate the activity of the compounds of the general formula I according to the invention.

Examples

The examples which follow illustrate the preparation of the compounds according to the invention.

Example 1

Methyl N-isotridecyl-2,6-dimethylmorpholinio-acetate chloride

30 g of N-isotridecyl-2,6-dimethylmorpholine and 10.9 g of methyl chloroacetate are refluxed for 20 hours in 100 ml of acetonitrile with addition of a catalytic amount of sodium iodide. The mixture is cooled and the solvent is distilled off in vacuo. The product is triturated in n-hexane. After concentration in vacuo,

38 g of a yellowish-brown viscous oil are obtained (compound No. 5).

IR spectrum (film): C = O - absorption 1740 cm^{-1} .

5 Example 2

3,4-Dichlorophenyl N-isotridecyl-2,6-dimethyl-morpholinio-acetate chloride

30 g of N-isotridecyl-2,6-dimethylmorpholine and 24 g
10 of 3,4-dichlorophenyl chloroacetate are refluxed for 16
hours in 100 ml of n-butanol with addition of a
catalytic amount of sodium iodide. The mixture is
cooled and the solvent is distilled off in vacuo. The
product which remains is dissolved in a little diethyl
15 ether and treated with n-hexane until its separation as
oily phase is complete. After concentration in vacuo,
48 g of a dark brown resin are obtained (compound No.
55).

IR spectrum (film): C = O - absorption 1740 cm^{-1}

20 C = C - absorption (aromatic) 1590 cm^{-1}

Example 3

Methyl 2-(N-isotridecyl-2,6-dimethyl-morpholinio)propionate chloride

25

20 g of methyl 2-(2,6-dimethylmorpholino)propionate and
22 g of iso-tridecyl chloride (mixture of different C_{11} -
 C_{14} -alkyl chlorides containing 60 to 70% of n-tridecyl
chloride) in 100 ml of dimethylformamide are refluxed
30 for 10 hours. After cooling, the solvent is distilled
off in vacuo. The product is dissolved in a little
acetone and treated with n-hexane until its separation
as oily phase is complete. Concentration in vacuo gives
19 g of a pale brown resin (compound No. 8).

35 IR spectrum (film): C = O - absorption 1735 cm^{-1}

Example 4

3-(N-iso-Tridecyl-2,6-dimethylmorpholinio)propyl 2,6-dimethylphenyl ether bromide

15 g of N-iso-tridecyl-2,6-dimethylmorpholine and
12.2 g of 3-bromopropyl 2,6-dimethylphenyl ether in
50 ml of acetonitrile are refluxed for 23 hours with
5 addition of a catalytic amount of sodium iodide. After
cooling, the solvent is distilled off in vacuo. The
residue is taken up in a little acetone and the
solution is treated with n-hexane until separation is
complete. The oily phase is separated off and freed
10 from residue solvent in vacuo. This gives 21 g of a
yellowish-brown viscose oil (compound No. 107).

Example 5

2-(N-iso-Tridecyl-2,6-dimethylmorpholinio)-ethyl 3,4-
15 dichlorophenyl ether chloride

17 g of 2-(2,6-dimethylmorpholino)-ethyl 3,4-
dichlorophenyl ether and 11 g of iso-tridecyl chloride
(mixture of various C₁₁-C₁₄-alkyl halides containing 60
20 to 70% of n-tridecyl chloride) in 50 ml of dimethyl-
formamide are refluxed for 10 hours. The mixture is
allowed to cool and the solvent is distilled off in
vacuo. The residue which remains is dissolved in a
little acetone and treated with n-hexane until its
25 complete separation as oily phase.

The product is separated off and freed from residual
solvent in vacuo. This gives 19 g of a brown resin-like
product (compound No. 106).

30

The compounds of the general formula I listed
hereinbelow, which, as a rule, are yellow to brown
viscous oils or resins, are readily soluble in polar
solvents such as, for example, alcohols, acetone,
35 dimethylformamide and dimethyl sulphoxide and are
characterized by IR spectra are prepared analogously.

The compounds of the general formula I according to the invention can be employed for example in the form of the following preparations:

5 Example I

Solution concentrates: 80 parts by weight of compound 5 are mixed with 20 parts by weight of n-methyl-2-pyrrolidone. This gives a solution which is suitable for use in the form of microdrops.

10

Example II

Emulsifiable concentrates: 25 parts by weight of compound 55 are mixed with 2.5 parts by weight of epoxidized vegetable oil, 10 parts by weight of an alkylarylsulphonate/fatty alcohol polyglycol ether mixture, 5 parts by weight of dimethylformamide and 57.5 parts by weight of xylene. Emulsions of any desired concentration can be prepared from this concentrate by diluting it with water.

20

Example III

Wettable powder: 40 parts by weight of compound 65 are mixed thoroughly with 5 parts by weight of the sodium salt of a ligninsulphonic acid from a sulphite waste liquor, 1 part by weight of diisobutylnaphthalene-sulphonic acid sodium salt and 54 parts by weight of silica gel, and the mixture is ground in a suitable mill. This gives a wettable powder which can be diluted with water to give suspensions of any desired concentration.

30

Example IV

Dust: 5 parts by weight of compound 55 are mixed intimately with 95 parts by weight of finely divided kaolin and the mixture is ground. For use, the dusts can be dusted in this form.

35

Example V

Granules: 5 parts by weight of compound 57 are mixed with 0.25 part by weight of epichlorohydrin and the mixture is dissolved using 6 parts by weight of acetone. Thereafter, 3.5 parts by weight of polyethylene glycol and 0.25 part by weight of cetyl polyglycol ether are added. The resulting solution is sprayed onto kaolin. Thereafter, the acetone is evaporated in vacuo. This give microgranules which can be employed in this form.

Without imposing any limitation, the examples which follow are intended to illustrate the invention in greater detail and to demonstrate the activity of the compounds of the general formula I:

Example A

Mycelial growth test

The fungicidal activity of the compositions against the test fungi is determined in the customary manner as the inhibition of the radial mycelial growth on malt agar medium (2% malt) in Petri dishes of 9 cm diameter at an incubation temperature of 25°C. To this end, the active compounds are dissolved in dimethylformamide, diluted with water and in this form admixed to the liquid agar so that the desired active compound concentration in the medium is obtained. The DMF content does not exceed 0.5% by volume. After cooling, the plates are inoculated. Depending on the growth rate of the fungi, the plates are evaluated when the controls without added active compound show growth across 70 to 90% of the diameter of the dish. The percentage growth inhibition of the active compounds is calculated (Table A).

Table A: Fungal growth inhibition in the mycelial growth test

5

Example B

Powdery mildew of barley test (Erysiphe graminis/barley)

5 In tubes filled with sand, barley plants cv. "Astacus"
in the one-leaf-stage are sprayed until dew-moist with
active compound preparations which are prepared from
1 part by weight of active compound, 100 parts by
weight of dimethylformamide and 0.25 part by weight of
10 alkylaryl polyglycol ether and which are diluted with
water to the desired active compound concentration.
After the spray coating has dried on, the plants are
dusted with conidia of powdery mildew of barley
(Erysiphe graminis var. hordei). Thereafter, the test
15 plants are placed for a period of 2 to 3 hours into an
incubation cabinet at a relative atmospheric humidity
of 90 to 100% and thereafter in a greenhouse at
temperatures between 20 and 22°C and a relative
atmospheric humidity of 75 to 80%. The mildew
20 infestation of the barley plants is determined after 7
days. The score values obtained according to the
Stephan system (Arch. Phytopath., Pfl.-schutz 14
(1978), 163-175) are converted into the disease level
of Krüger's system (Nachr.-Bl. Pflanzenschutz DDR 1981,
25 145-147). These data are used to calculate the ABBOTT
efficiency using the formula

$$\text{EFF (in \%)} = \frac{\text{diseaselevel}(\text{control}) - \text{diseaselevel}(\text{variant})}{\text{diseaselevel}(\text{control})} \times 100$$

30 The results can be seen from Table B.

Table B: Activity against *Erysiphe graminis* on barley
Active compound concentration: 10 mg/l

Compound No.	Efficiency in percent
N-Methyl-N-tridecyl-2,6-dimethyl- morpholine methosulphate (disclosed in DE-PS 11 67 588)	82

Example C

Powdery mildew of wheat test (*Erysiphe graminis*/wheat)

5 Pot-grown wheat plants cv. "Alcedo" in the one-leaf-
stage are sprayed until dew-moist with active compound
preparations which are prepared from 1 part by weight
of active compound, 100 parts by weight of
10 dimethylformamide and 0.25 part by weight of alkylaryl
polyglycol ether and which are diluted with water to
the desired active compound concentration. After the
spray coating has dried on, the plants are dusted with
conidia (spores) of powdery mildew of wheat (*Erysiphe*
graminis var. *tritici*). Thereafter, the test plants are
15 placed for a period of 2 to 3 hours into an incubation
cabinet at a relative atmospheric humidity of 90 to
100% and thereafter in a greenhouse at temperatures
between 20 and 22°C and a relative atmospheric humidity
of 75 to 80%.

20

The mildew infestation of the wheat plants is
determined after 5 days.

The efficacy of the compositions is calculated using
the method described in Example B.

25 The results can be seen from Table C.

Table C: Activity against *Erysiphe graminis* on wheat
Active compound concentration: 100 mg/l

Compound No.	Efficiency in percent
N-Methyl-N-tridecyl-2,6-dimethyl- morpholinium methosulphate (disclosed in DE-PS 11 67 588)	67
5	88

Example D

Cereal rust test (*Puccinia recondita*/wheat)

5 Pot-grown wheat plants cv. "Alcedo" in the two-leaf stage are cut back to a length of 12 cm. The secondary leaf of the plants is removed. Then, the wheat plants are sprayed with active compound preparations which are prepared from 20 parts by weight of active compound, 10
10 parts by weight of polyoxyethylene sorbitan monostearate (Tween 60), 5 parts by weight of polypropylene glycol, 25 parts by weight of cyclohexanone and 40 parts by weight of toluene and diluted with water to the desired active compound
15 concentration. After the spray coating has dried on, the plants are inoculated with spores of leaf rust of wheat (*Puccinia recondita*) which are applied in the form of a slurry in water with addition of Tween 60. Thereafter, the test plants are placed into a water-
20 vapour-saturated incubation cabinet for a period of 24 hours and thereafter in a greenhouse at temperatures of from 20 to 22°C and a relative atmospheric humidity of 70 to 80%.

The rust infection of the wheat plants is determined
25 after 10 days.

The efficacy of the compositions is calculated using the method described in Example B.

The results can be seen from Table D.

30 Table D: Activity against *Puccinia recondita* on wheat
Active compound concentration: 500 mg/l

Compound No.	Efficacy in percent
Triforine (known)	85
105	99
107	98
5	95

Example E

Powdery mildew of cucurbits test (mixed culture of *Erysiphe cichoracearum* and *Sphaerotheca fuliginea*/cucumber)

5

Pot-grown cucumber plants cv. "Eva" in the four-leaf-stage are inoculated with a conidial suspension of a mixed culture of *Erysiphe cichoracearum* and *Sphaerotheca fuliginea*. After 4 days, the plants are
10 sprayed until dew-moist with active compound preparations which are prepared from 1 part by weight of active compound, 100 parts by weight of dimethylformamide and 0.25 part by weight of alkylaryl polyglycol ether and diluted with water to the desired
15 active compound concentration. After the spray coating has dried on, the plants are placed in a greenhouse at a temperature of 20°C under relative atmospheric humidity of 70 to 80%. The mildew infection of the cucumber plants is determined after 6 and 9 days. The
20 score values obtained by the system of Bolle (Nachrichtbl. Dt. Pflanzenschutzdienst 16 (1964), 92-94) are converted into the disease level of Krüger's system and these data are used for calculating the Abbot efficiency.

25 The results can be seen from Table E.

Table E: Activity against *Erysiphe cichoracearum* and *Sphaerotheca fuliginea* (mixed culture) on cucumbers

30 Active compound concentration: 500 mg/l

Compound No.

Days after application of the
composition

	6	9
Tridemorph (known)	100	88
5	100	100

Example F

Botrytis test (Botrytis cinerea/field bean (Vicia faba) pinnule)

- 5 Excised pinnules of pot-grown field bean plants (Vicia faba) cv. "Fribo" in the four-leaf stage are brushed with active compound preparations which are prepared from 1 part by weight of active compound, 100 parts by weight of dimethylformamide and 0.25 part by weight of
- 10 alkylaryl polyglycol ether and diluted with water to the desired active compound concentration. After the spray coating has dried on, the leaves are inoculated with a conidial suspension of Botrytis cinerea which is obtained by rinsing off 12- to 16-day old fungal
- 15 cultures on malt agar medium (2% malt). The field-bean pinnules are kept in dishes in an incubation cabinet at a temperature of 22°C under relative atmospheric humidity of 90 to 100%.

After 4 days, the Botrytis infection of the field-bean

20 pinnules is determined. The percentage infection based on all of the leaf area is converted into the Abbot efficacy of the compositions.

The results can be seen from Table F.

- 25 Table F: Activity against Botrytis cinerea on field bean (Vicia faba) pinnules
Active compound concentration: 100 mg/l

Compound No.	Efficiency in percent
Tridemorph (known)	42
5	45
14	68
55	48
105	62
106	47
107	51

Example G

Phytophthora test (Phytophthora infestans/tomato)

Pot-grown tomato plants cv. "Tamina" in the three-leaf-
5 stage are sprayed to dew point with active compound
preparations which are prepared from 1 part by weight
of active compound, 100 parts by weight of
dimethylformamide and 0.25 part by weight of alkylaryl
polyglycol ether and diluted with water to give the
10 desired active compound concentration. After the spray
coating has dried on, the tomato plants are inoculated
with an aqueous zoospore suspension of Phytophthora
infestans. Thereafter, the test plants are placed into
an incubation cabinet at temperatures of between 18 and
15 20°C and a relative atmospheric humidity of 95 to 100%.
The Phytophthora infection of the tomato plants is
determined after 5 days. The scores obtained are
converted into the disease level and the efficacy of
the compositions as described in Example B.
20 The results are shown in Table G.

Table G: Activity against Phytophthora infestans on
tomatoes

Compound No.	Active compound concentration in mg/l	efficiency in percent
Zineb (known)	100	57
	200	61
105	100	66
	200	79

Example H

Plant growth regulation test

Cucumber plants cv. "Eva" are grown in the greenhouse
5 to a height of 9 cm in pots in rich humus compost. Ten
plants are used for each test variant. The cucumber
plants are sprayed with active compound preparations
which are prepared from 1 part by weight of active
compound, 100 parts by weight of dimethylformamide and
10 0.25 part by weight of alkylaryl polyglycol ether and
diluted with water to the desired active compound
concentration.

After a growth period of 14 days after the compositions
have been applied, longitudinal measurements are
15 carried out on the treated plants and the untreated
control plants.

The results can be seen from Table H.

20 Table H: Effect of foliar treatment on the
longitudinal growth of cucumber plants
Active compound concentration: 1000 mg/l

Compound No.	Plant height	
	in cm	relative
untreated control	23	100
5	15.6	68
105	15	65

Patent Claims

1. N-Alkyl-2,6-dimethylmorpholinocarboxylic ester
salt and N-alkyl-2,6-dimethylmorpholinio alkyl-
5 phenyl ether salt of the general formula I,

wherein A represents the group

10

in which

R¹ represents straight-chain or branched alkyl
having 6 to 20 C atoms,

15 R² represents straight-chain or branched alkylene
having 1 to 6 C atoms,

R³ represents straight-chain or branched alkyl
having 1 to 20 C atoms,

20 a straight-chain or branched alkyl which has 1
to 6 C atoms and which is substituted by
halogen, hydroxyl, alkoxy having 1 to 4 C
atoms, dialkylamino having 2 to 16 C atoms,
nitro and/or cyano,

an alkenyl which has 2 to 6 C atoms and which
is optionally substituted by halogen,

25 alkynyl having 3 to 6 C atoms,

cycloalkyl having 3 to 12 carbon atoms, it
being possible for the cycloalkyl radical

optionally to be substituted by one or more
alkyl radicals having 1 to 7 C atoms,
cycloalkylalkyl having 4 to 10 C atoms,
aryl which can be monosubstituted or
5 polysubstituted by identical or different
substituents from the series consisting of
straight-chain or branched alkyl having 1 to 6
C atoms, alkoxy having 1 to 4 C atoms, aryl-
lower-alkyl having 7 to 12 C atoms, acyl having
10 1 to 4 C atoms, halogen, aryl, nitro and/or
cyano,
aryl-lower-alkyl which has 7 to 12 C atoms and
which can be monosubstituted or polysubstituted
by identical or different substituents from the
15 series consisting of straight-chain or branched
alkyl having 1 to 6 C atoms, alkoxy having 1 to
4 C atoms, halogen, haloalkyl having 1 to 4 C
atoms, nitro and/or cyano,
R⁴, R⁵ and R⁶ independently of one another
20 represent identical or different substituents
from the series consisting of hydrogen,
straight-chain or branched alkyl having 1 to 6
C atoms, alkoxy having 1 to 4 C atoms, acyl
having 1 to 4 C atoms, halogen, haloalkyl
25 having 1 to 4 C atoms, cycloalkyl having 3 to 7
C atoms, aryl-lower-alkyl having 7 to 12 C
atoms, aryl, nitro, cyano, thiocyanato, NHCOR',
COOR' and/or CONR'R" it being possible for R'
and R" independently of one another to
30 represent hydrogen, straight-chain or branched
alkyl having 1 to 6 C atoms, aryl or aryl-
lower-alkyl having 7 to 12 C atoms,
Z represents oxygen or sulphur and
X⁻ represents the anion of a nonphytotoxic acid,
35 or R³ and X⁻ are absent.

2. Compounds according to Claim 1, characterized in
that R² is CH₂ or CH(CH)₃, R³ is C₁-C₁₄-alkyl and Z
is oxygen.

3. Compounds according to Claim 1, characterized in that R^2 is CH_2 , R^3 is halophenyl and Z is oxygen.
- 5 4. Compounds according to Claim 1, characterized in that R^2 is CH_2 , R^3 is alkylphenyl having 7 to 12 C atoms and Z is oxygen.
- 10 5. Process for the preparation of N-alkyl-2,6-dimethylmorpholinocarboxylic ester salts and N-alkyl-2,6-dimethylmorpholinio alkylphenyl ether salts of the general formula I, characterized in that
- 15 a) an N-alkyl-2,6-dimethylmorpholine of the formula II,

- 20 wherein R^1 has the meaning given in the general formula I
is reacted with a compound of the formula III

- 25 wherein R^2 and A have the meaning given in the general formula I and X represents halogen,
or,
- 30 b) a 2,6-dimethylmorpholinocarboxylic ester or 2,6-dimethylmorpholino alkylphenyl ether of the formula IV,

wherein R^2 and A have the meaning given in the general formula I

5 is reacted with a compound of the formula V,

10 wherein R^1 has the meaning given in the general formula I and X represents halogen.

6. Fungicidal compositions with additional plant-growth-regulatory activity, containing at least one compound of the general formula I according to Claim 1.

7. Fungicidal compositions with additional plant-growth-regulatory activity, containing at least one compound of the general formula I according to Claim 1 in admixture with inert additives.

8. Method of combating fungi, characterized in that at least one compound of the general formula I according to Claim 1 is allowed to act on fungi or on the objects to be protected from fungal infection.

9. Use of compounds of the general formula I according to Claim 1 for combating fungi and/or for regulating the growth of plants.
